

## LAB ASSESSMENT -3

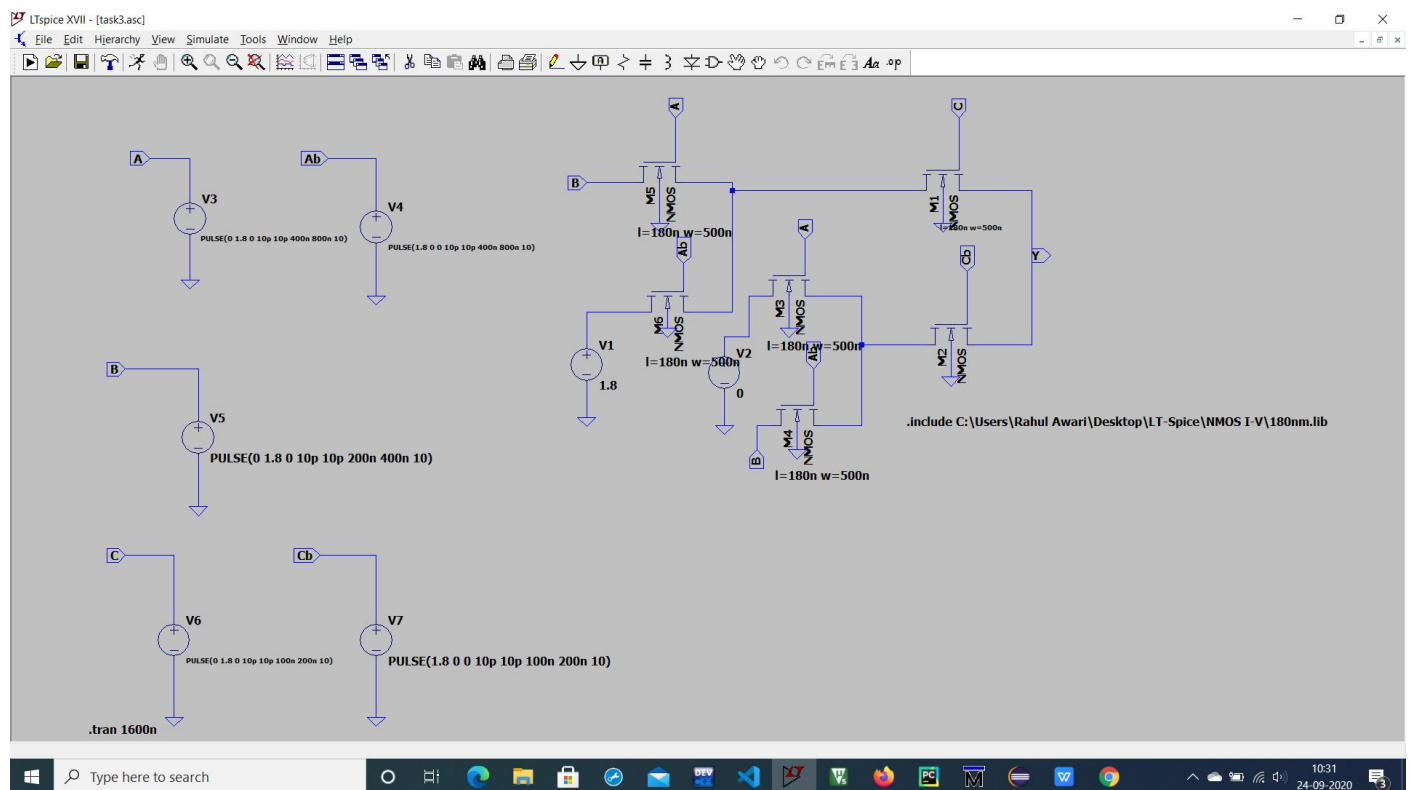

NAME: Rahul Mahesh Awari

REGISTER NUMBER: 18BEC2014

SUBJECT : VLSI SYSTEM DESIGN (ECE3002-ELA)

SLOT : L43 + L44

FACULTY : PROF. JAGANNADHA NAIDU K

## GRAPHS:-

### I) Functionality

A) Length of NMOS-180nm

B) Width of NMOS-500nm

2) Pulse Voltage is used with following input :-

V1=0

V2=1.8

Tdelay=0

Trise=10p

Tfall=10p

Ton=400n

Tperiod=800n

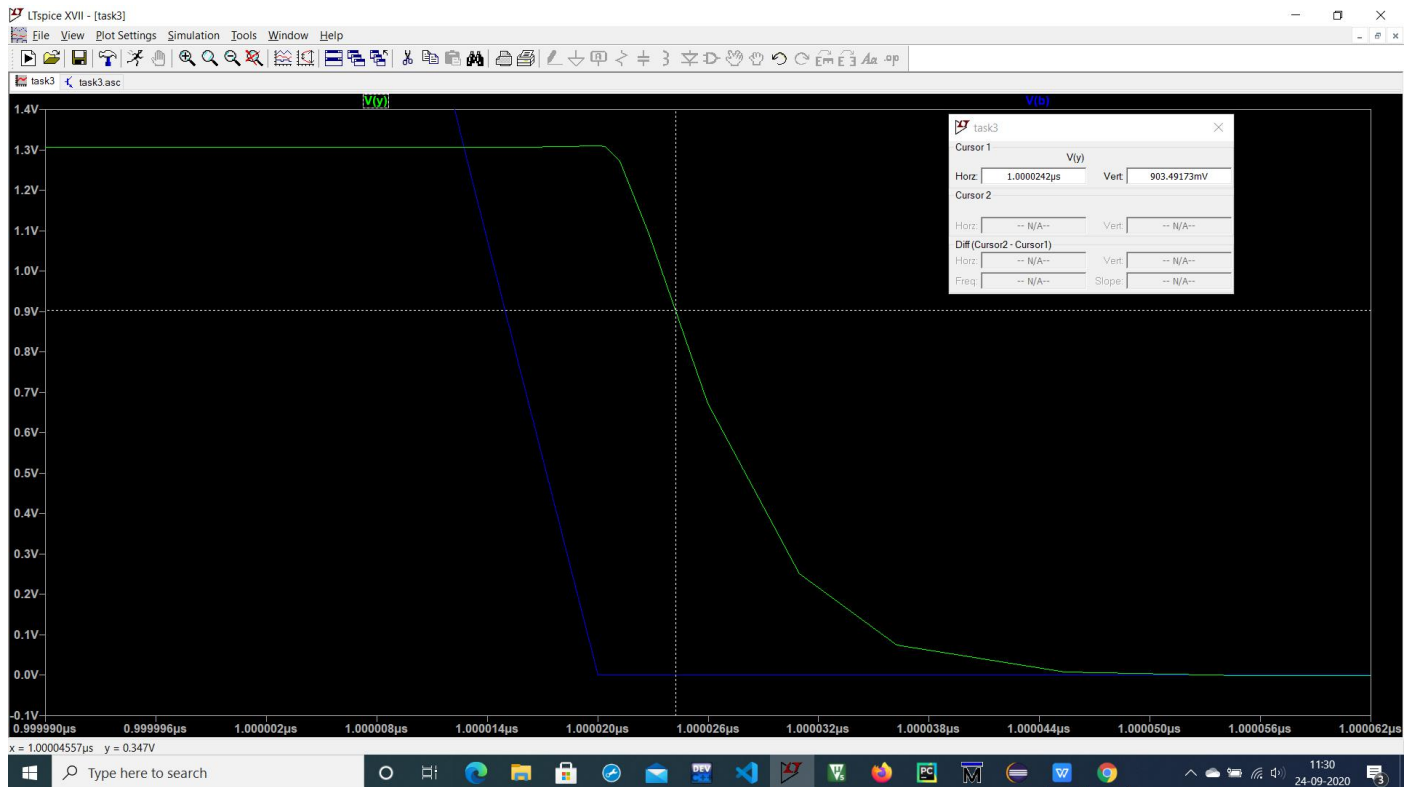

Ncycles=10.

### II) DELAY ESTIMATION

It is observed from truth table that when Input A and C is low or high the output observed At Y is same as input B. Hence This condition is used for delay estimation.

A=0,C=0, B(0→1.8)

## GRAPHS:-

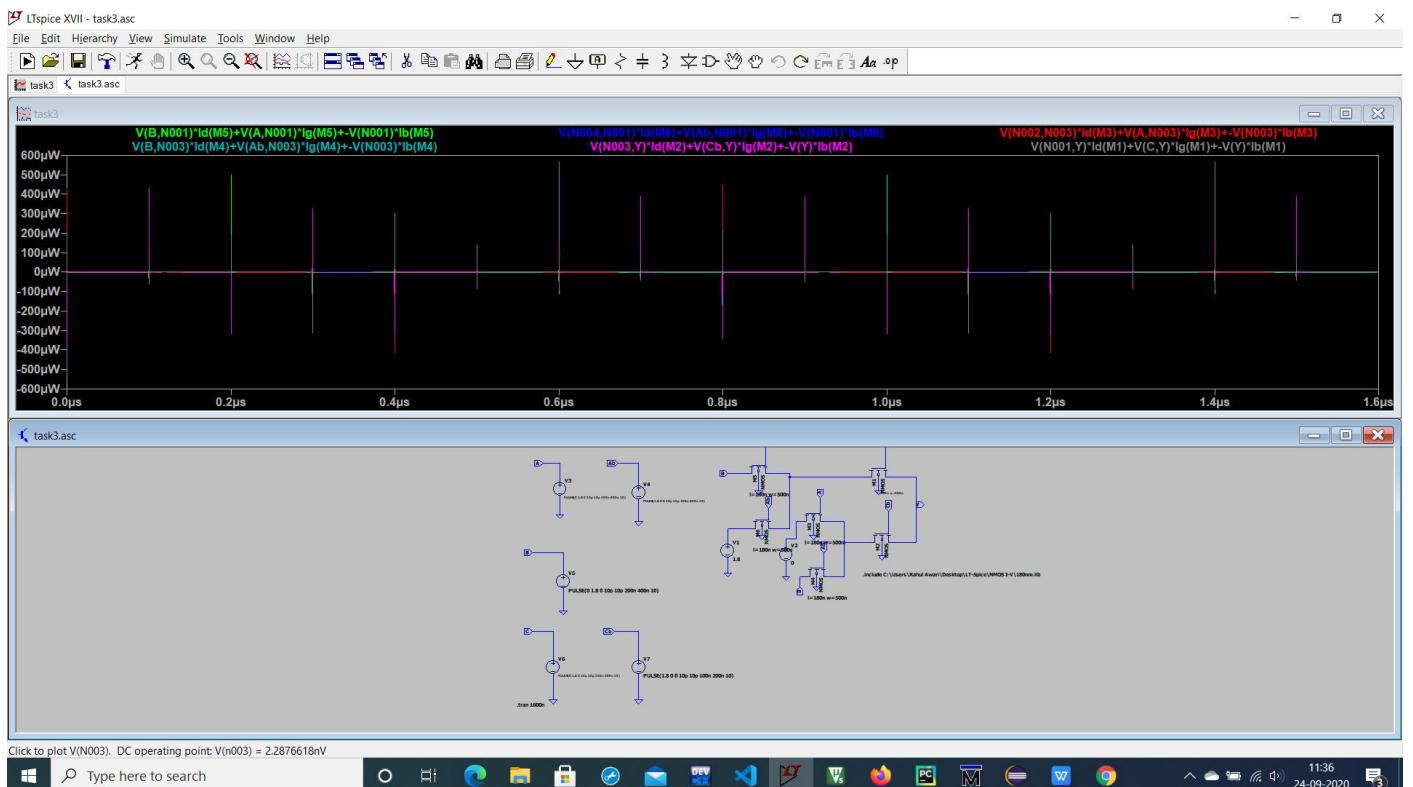

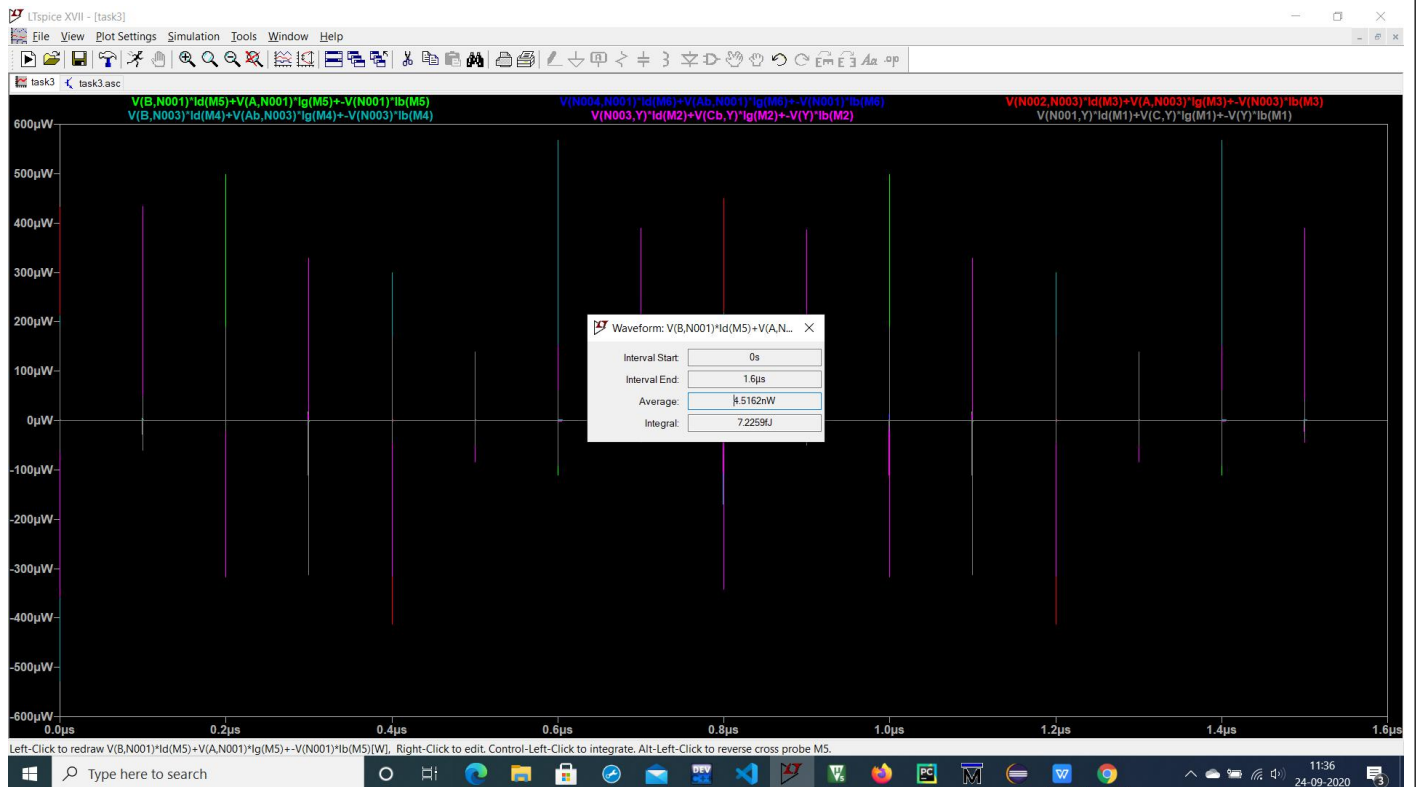

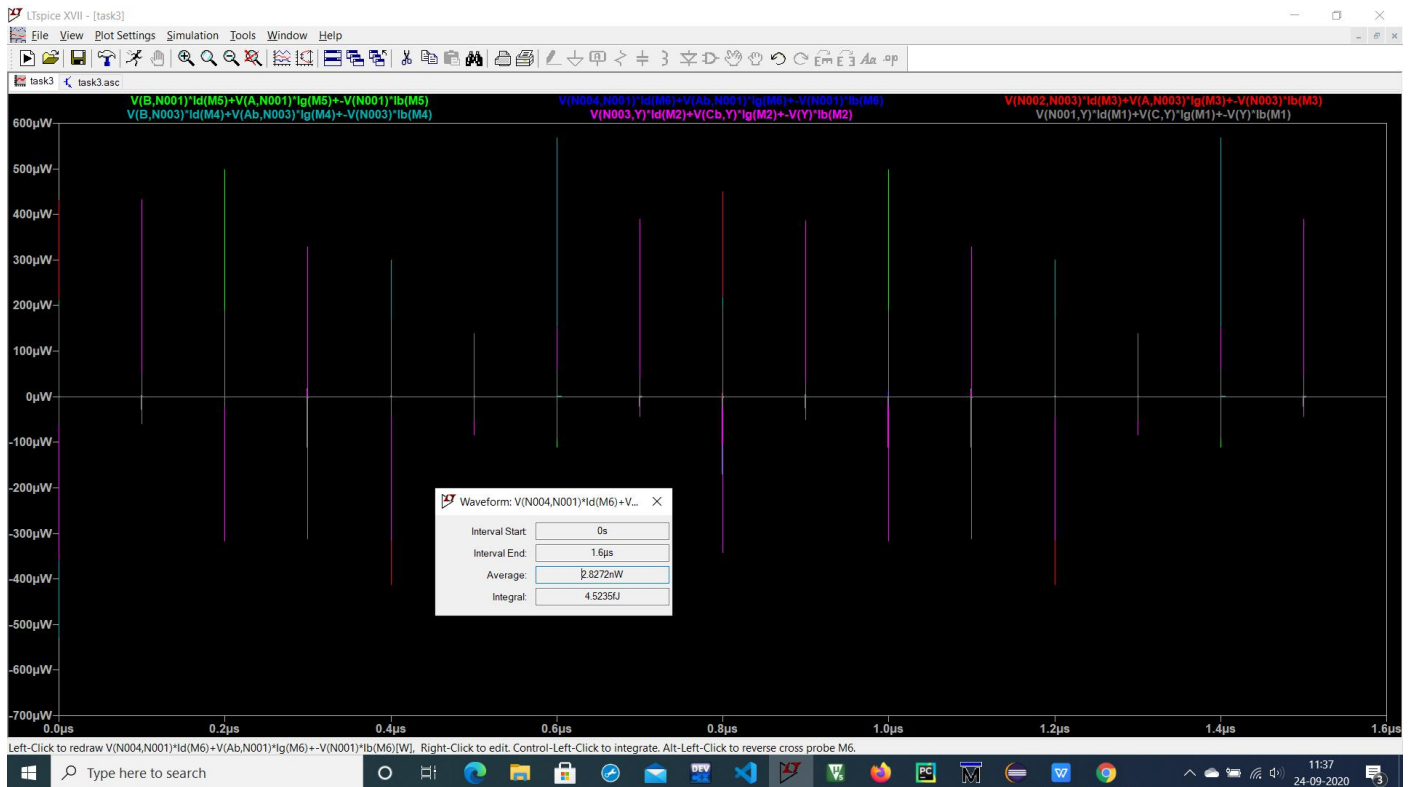

## iii) POWER ESTIMATION:-

To Calculate Avg power emitted by each transistor.

## GRAPHS:-

## CALCULATIONS:-

### I) DELAY ESTIMATIONS:-

#### Case1)

A=0

C=0

B(0→1.8)

T1=1.200005us

T2=1.2000359us

T3=1.0000243us

T4=1.000016us

Tpdr=30.9ps

Tpdf=9.3ps

#### Case2)

A=1

C=1

B(1.8→0)

T1=1.0000465us

T2=1.000015us

T3=1.2000143us

T4=1.2000050us

$T_{pdr}=31.5\text{ps}$

$T_{pdf}=9.3\text{ps}$

### **POWER ESTIMATION:-**

M1	4.5162nW
M2	6.3008nW
M3	2.8272nW
M4	3.9735nW
M5	1.34nW
M6	4.12nW

Avg Power=23.2026nW

### **INFERENCE:-**

- 1) The given boolean expression is implemented using pass transistor logic using only NMOS.
- 2) For Delay estimation ,It is observed from truth table that the input B is reflected at output Y,irrespective of input A and C.
- 3) So for delay estimation we consider situation of  $A=0, C=0$  and  $B(0 \rightarrow 1.8)$  And Case 2  $A=1.8, C=1.8$  and  $B(1.8 \rightarrow 0)$ .
- 4) Time at which value is  $V_{dd}/2$  is observed for both input B and output Y and The difference is used for the calculation of time delay.
- 5) The rise delay is observed to be around 30.9ps and fall delay to be 9.3ps
- 6) The average power calculated is the cumulative power of all the six transistor.
- 7) In functionality graph is can be observed that for A is on B is propagated and values similar to truth table.
